--- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
--- ALTERNATIVE PRODUCTS: 3 isoforms; 1 (shown here) and 2; are produced by alternative splicing. Isoform 3 may be very rare or due to a cloning artifact.
--- TISSUE SPECIFICITY: PREPERENTIALLY EXPRESSED IN LIVER. EXPRESSION IS ALSO SEEN IN THE HEMATOPOLETIC CELLS SUCH AS BONE MARROW, THYMUS AND SPLEEN. LOWER EXPRESSION SEEN IN THE HEBATT, KIDNEY AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mano H., Ishikawa F., Nishida J., Hirai H., Takaku F., "A novel protein-tyrosine kinase, tec, is preferentially expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -!- FUNCTION: MAY BE AN IMPORTANT SIGNAL TRANSDUCER FOR CELL DIVISION AND/OR FOR DIFFERENTIATION IN THE LIVER SYSTEM.

The DNA is used to produce the TAK-1 protein which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK Kinase (AMK-1), is an enzyme which is activated by TGF-beta and bone morphogenetic protein (BMF) and activates MAPK kinase by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A method has been developed for screening for substances which inhibit to the binding of TARI polypeptide to TARI polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with TARI or TARI polypeptide first. The transforming growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors or activators, or monocyte migration inhibitors or activators, or physiological activity induction inhibitors or activators, or inmunosuppression inhibitors or activators, or amyloid beta protein precipitation inhibitors or activators, and such substances can also be inhibitors of the TAKI polypeptide function, particularly Kinase activity. The present sequence represents human TAKI.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method for screening compounds for inhibition of inflammatory cytokine signal transduction by contacting the sample with TAKI and its receptor TABI and selecting for inhibition of TAKI/TABI binding. Also described is a method for screening compounds for TAKI/TABI binding of screening compounds inhibition of TAKI phosphorylation is selected for; and frug the inhibitions for the treatment of inflammatory disorders containing as active component an inflammatory cytokine signal transduction inhibitor. TAKI is an essential component of the signalling process which results in release of inflammatory cytokines such as interleukin-1 (IL-1), IL-10, tumour necrosis factor (TNF) and IL-6. The methods can be used for the selection of effective antiinflammatory agents. The present sequence represents human TAK-1, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0

A method has been developed for screening for substances which inhibit the binding of TAKI polypeptide to TABI polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample; and (b) detecting the amount of bound polypeptide, in which the sample; and be pre-mixed with TAKI or TABI polypeptide first. The transforming growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or monocyte migration inhibitors or activators, or activators, or monocyte migration inhibitors or activators, or munication inhibitors or activators, or amyloid beta protein precipitation inhibitors or activators, and such substances can also be inhibitors of the TAKI polypeptide function, particularly kinase activity. The present sequence represents TAKI-6XHis from an example of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MSTASAASSSSSSSAGEMIEAPSQVLNFEEIDYKEIEVEEVVGRGAFGVVCKAKWRAKDV

The NFkB activation inhibitors targeting on TAK1 can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The process of the service of the service represents the amino acid sequence of human TAK1a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to identifying pain-regulating substances (A) comprises (i) incubating a test substance with a cell (or preparation from it) that has synthesised a peptide or protein (B) and (ii) measuring either binding of the test substance to (B) or some functional parameter pain-regulating substances (A) with analgesic activity. (A) along with nucleic acid (ABL88411-ABL88441) that encode proteins (B. mucleic acid; ABL885037) that interact with (A); (B); vectors containing the nucleic acid; antibodies against (B); cells that express (B) and agents that bind to (B), are all useful for treating pain, particularly chronic pain, including use in gene therapy. The same materials can also be used for diagnosis, e.g. of neurological and neurodegenerative diseases. The present sequence is that of a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pain

The DNA is used to produce the TAK-1 protein which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK Kinase (AMK-1), is an enzyme which is activated by TGF-beta and bone morphogenetic protein (BMP) and activates MAPK kinase by

The NFkB activated inhibitors targeting on TAKI can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as attrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the amino acid sequence of human TAKIb

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase I (TAKI). The NPKB activation inhibitors targeting on TAKI can be used to intractable diseases with inflammation (such as atrophic dermaticis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the amino acid sequence of human TAKIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. They may be used to therapy, and can be useful in genetic vaccination, testing and therapy, and can be used as mutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches 259;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBD7377-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2001-656860/75.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     185 KSNRIIINQPTGFQKVLQGNKPDEKCDVYSWAITFWEILSRKEPFEQY-NTLFELYMAIN 243

The present sequence represents a human regulator of intracellular phosphorylation (HRIP). HRIP is useful for screening agonists and antagonists of HRIP polypeptide. HRIP and its agonist or antagonist are useful for treating a disease or condition associated with decreased or increased expression of functional HRIP. Diseases treated or diagnosed include neurological disorders such as stroke, Parkinson's

demyelinating

diseases,

bacterial

and viral

meningitis and

Parkinson's

cell signal transduction pathways such as mitogen-activated protein kinase pathways. A protein kinase activity means that the SRK can catalyse a reaction in which a phosphate group is transferred from a phosphate donor to a phosphate acceptor amino acid residue, preferably the hydroxyl side chain of a serine or threonine. Substrates for SRK include SRK, MBP and BAD and SRK sprotein kinase activity is similar to that of a MapKKK such as Raf. has a range of other activities including a cell growth-regulatory activity, a cell survival promocing activity, a HAX-1 binding activity, an apoptosis suppressing activity a MAPKK activation or stimulatory activity, a nuclear targeting activity and a SRK-specific immunogenic activity. SRK is useful for identifying agents which modulate cellular transformations mediated by Ras and SRK-missing may be useful in the transformation activity of SRK. This information may be useful in the treatment of autoimmune diseases, tumours and apoptosis
                                                                                                                                Novel human survival regulating kinase polypeptide for screening agents which modulate biological pathways associated with SRK useful in treating autoimmune diseases, tumors and apoptosis-related disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  regulating kinases (SRK) are a class of proteins involved in
